HYDRAULIC JIB AND WINCH - The material handling jib and winch consists of a winch and a jib pole that are automatically leveled with the platform. Up to 1,000 lbs. (454 kg) material-handling capacity can be provided at elevated boom angles. The winch is hydraulically powered through a self-locking worm gear drive, so a load-holding brake is not required. The winch provides line speeds of 15 to 30' per minute (5 to 9m per min). Eighty feet (24 m) of VS" (13 mm) diameter polyester rope with a clevis hook is provided. The 4" (100 mm) square jib pole hydraulically tilts with 90° of travel relative to the platform, from horizontal to vertical. Since the pole is automatically leveled with the platform, there is a total of 200° of jib pole articulation relative to the upper boom. The jib pole also hydraulically extends and retracts, providing 16" (400-mm) travel, from 44" to 60" (1.1 to 1.5m). The jib-pole assembly also can be rotated to any of three convenient load-lifting positions to accommodate a load. The jib pole and winch assemblies can be rotated to a stowed position 180° from the end-hung position, or they can be easily removed when not needed.		
INDIVIDUAL LOWER CONTROLS - Individual full pressure controls at the turret actuate all boom functions. The lower control station is equipped with a selector valve to override the upper controls.		
TWO-SPEED MANUAL THROTTLE CONTROL - This control gives the operator a choice of efficient, economical engine idle speeds or faster engine speeds with faster lift movements when required. The manual throttle control is designed to operate only if both the truck ignition and the master control switch are "on". An air cylinder located with the upper controls operates the manual throttle control.		
LOWER BOOM WITH CHASSIS INSULATING SYSTEM - Each end of a high strength fiberglass insert (chassis insulating system) is installed inside a rectangular 8" x 10" (203mm x 254mm) high strength steel section. The steel and fiberglass sections are bonded with pressure-injected epoxy to fill any voids. After the adhesive cures, 16 bolts are added to assure maximum strength. A double acting cylinder, with two integral holding valves, articulates the lower boom. The lower boom and compensation link form a parallelogram linkage to maintain the knuckle at a constant angle to the turret.		
AUTOMATIC BOOM STOW FOR INNER OUTER BOOM- Automatically locks boom into the cradle when returned to the stow position, also automatically unlocks to allow boom movement during operations.		
OUTER/INNER BOOM ASSEMBLY- The outer/ inner boom assembly includes an outer boom, telescopic inner boom, extension system, and hose assemblies. The outer boom consists of an 8" x 10" (203 mm x 254 mm) steel section, with a 9" x 11" (229 mm x 279 mm) fiberglass Electrogard section. The 6 7/8" x 8 7/8" (165 mm x 216 mm) rectangular fiberglass inner boom is housed within the outer boom. The extension system consists of an extension cylinder, holding valves, and a hose carrier housed inside the boom. The hoses routed through the outer/inner boom assembly are non-conductive and fully contained within the boom assembly. A double acting cylinder with two integral holding valves articulates the outer/inner boom assembly. A boom support cradle and a boom tie down strap are included. The outer/inner boom assembly is fully insulated even in a retracted position.		

OUTRIGGERS - The modified A-frame outriggers are equipped with pilot operated check valves, internal thermal relief valves, pivot feet, and separate controls. At maximum extension the outriggers provide 158" (4.0 m) of spread and from 6" to 11" (15 cm to 28 cm) of penetration based on a 40" (1.02 m) frame height		
OUTRIGGER / BOOM INTERLOCK SYSTEM - The outrigger/boom interlock system prevents lift operation until the outriggers contact the ground and outrigger retraction before the aerial lift is properly stored.		
CYLINDERS - Both the upper and lower cylinders are a threaded head-cap design. Both are equipped with two integral holding valves that prevent down creep and to lock the booms in position in the event of hose failure.		
TURRET - The turret wings are designed for strength and rigidity. A bearing cover seals out moisture and prevents foreign materials from obstructing the turret rotation. The turret plate is machined to provide a flat surface to support the rotation bearing.		
CONTINUOUS ROTATION - Unrestricted rotation is accomplished by a hydraulically driven worm and spur gear with a shear-bail rotation bearing. The critical bolts holding the lift to the rotation bearing and the rotation bearing to the pedestal are grade 8 hex head cap screws. These critical bolts are torque seal marked to provide a quick means of detecting any turning of the bolt upon inspection. An eccentric ring is used for gearbox backlash adjustment.		
LUBRICATION - Non-lube bearings are used at most points of motion. Only the rotation bearing requires periodic lubrication.		
PEDESTAL - The pedestal is tubular with a reinforced mounting plate. The top plate of the pedestal is 1 1/4 in. (32 mm) thick and machined flat to support the rotation bearing.		
HYDRAULIC OIL RESERVOIR - A 17 gallon (64.41) hydraulic oil reservoir is built integral to the pedestal. Two sight gauges allow quick hydraulic fluid level checks.		
HYDRAULIC SYSTEM - The open-center hydraulic system operates at 3000 psi (210 kg/cm) at 6 gpm (22.7 lpm). A 10-micron return-line filter, mounted above the hydraulic oil level and inside the pedestal, can be easily changed without draining the reservoir. The 100 mesh (149 micron) suction strainer in the reservoir can be removed for cleaning. A gate valve, located below the reservoir, prevents oil loss when the pump is serviced. A magnetic drain plug attracts metal particles from the oil.		
PAINT - The complete unit is primed and painted prior to assembly. The color is white urethane.		
HOSES AND FITTINGS - The hoses routed through the booms are high pressure and non-conductive with swaged hose end fittings. Retainers separate the hoses inside the booms to prevent chafing and nylon sleeves are installed over hoses at points of movement. Reusable fittings can be installed if a hose is damaged.		
ENGINE START / STOP - The start/stop circuit has been designed so the lift cannot be operated unless the truck ignition switch is in the "RUN" position and the master control is activated. This feature makes it difficult for unauthorized individuals to operate the lift when the truck is locked. An air cylinder at the upper controls and a toggle switch at the pedestal energize this system.		
BACKUP PUMP - This system consists of a hydraulic pump driven by a DC motor, which is powered by the truck's engine battery. The system is connected in parallel with the main pump and is designed for non-continuous operation. An air cylinder at the upper controls is used to energize this system.		

ELECTRICAL INSULATION SPECIFICATIONS - The outer/inner boom assembly is tested and certified for electrical work at 46 KV and below in accordance with ANSI A92.2 requirements. The outer/inner boom assembly is fully insulated even in a retracted position. The chassis insulating system (lower boom insert) is also tested according to ANSI A92.2.		
LINE-LIFTING SOCKET - Built as part of the platform support structure, is a vertical line-lifting socket for 3 in. (76 mm) diameter line-lifting attachments. The socket is automatically leveled with the platform without any manual adjustments.		
SLOPE INDICATORS - Slope indicators are required on Versalift units and supplied by Time Manufacturing Co. Slope indicators shall be installed to indicate the level of the rotation bearing relative to the ground or approved equal.
